

# BrewHorn Instructions

## Profile the Beer

As you drink the beer answer these questions-

***"How well does each parameter meet your taste profile?"***

***"Somewhat too much/too little?"***

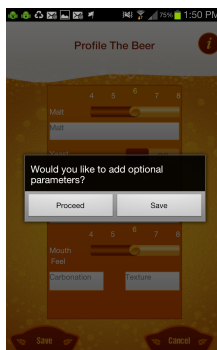

***"Much too much / too little?"***

***"Just right?"***

### IMPORTANT NOTE

For beer profiling, the value you set for each taste parameter now becomes the baseline for measuring a beer's taste against your taste preferences. For example, if you selected "6" (somewhat more) the beer profile range for that parameter becomes 4-5-**6**-7-8.

1. Tap on the taste parameter name to read a description.
2. Slide each taste parameter ● according to how well that particular parameter met your taste profile baseline. Leave it where it is if the parameter was a good match.
3. Tap  to drop down values to describe each parameter. You may select as many as you desire for each parameter.
4. You have the option to turn Yeast on / off ☐ OFF if yeast is not a prominent taste in the beer style you are drinking. (Yeast flavor characteristics are typically prominent in wheat and Belgian ales)
5. Tap on  to advance to the next screen of parameters.
6. After the second parameter screen you will be prompted with an alert saying, ***"Would you like to add optional parameters?"***

- a. Tap ***Proceed*** if you are drinking a Sour, Additive, or Boozy (8% or above) beer.
  - b. Tap ***Save*** if Sour, Additive, or Boozy does not apply.
  - c. Toggle the optional parameters on / off according to the parameters you need to measure.
7. Tap  to save the beer profile to the BrewHorn database.
